Mathematics 105 SOLUTIONS
Professor Alan H. Stein
October 1, 2007

1. List the three elementary row operations on matrices.

   Solution:

   - Interchange two rows.
   - Multiply (or divide) a row by a non-zero constant.
   - Add (or subtract) a multiple of one row to (or from) another row.

2. Consider the following arithmetical expression:
   $$\frac{5.3 \cdot 2.1^{1.57+0.4 \cdot 1.3} + 8.1 \ln 2.7}{\frac{5.4}{1.7} - 2.1 \cdot 0.043}.$$
   Use your calculator, abiding by the restrictions given for the similar question in class, to evaluate the expression to the full precision available. List the sequence of keys you pressed. For example, if you were calculating $5 + 3 \ln 8.3$, you might list $5 + 3 \times \ln(8.3)$ enter.

   Solution: $(5.3 \times 2.1 \wedge (1.57 + 0.4 \times 1.3) + 8.1 \times \ln(2.7)) \div (5.4 \div 1.7 - 2.1 \times 0.043)$ ENTER

   The result should be 10.7033434965.

3. Sketch the feasible set for the following system of inequalities:

   $2x + y \geq 8$
   $3x - y \leq 2$
   $x \geq 0$, $y \geq 0$.

   Solution: The line $2x + y = 8$ has x-intercept 4 and y-intercept 8. The inequality is satisfied by the points above the line, so we shade in the points below the line.

   The line $3x - y = 2$ has x-intercept $\frac{2}{3}$ and y-intercept -2. The inequality is satisfied by the points to the left of the line, so we shade in the points to the right.

   We also shade in the points to the left of the y-axis and the points below the x-axis, leaving a region in the first quadrant above the graph of $2x +$

4. Consider supply and demand functions $S(x) = 3 \cdot 10^{-6}x$ and $D(x) = 40 - 10^{-6}x$. Using the notation used in class, sketch their graphs and find the equilibrium price and demand.

   Solution: It's easiest to equate the supply and demand, getting $3 \cdot 10^{-6}x = 40 - 10^{-6}x$, $4 \cdot 10^{-6}x = 40$, $x = \dfrac{40}{4 \cdot 10^{-6}} = 10^7$.

   For that value, $S(10^7) = 3 \cdot 10^{-6} \cdot 10^7 = 3 \cdot 10 = 30$.

   We thus get an equilibrium price of 30 and an equilibrium demand of 10 million.

5. Write down the augmented matrix for the system

$$\begin{aligned} 5x - 4y + 8z &= 83 \\ -2x + 5z &= 53 \\ 4x - 3y - 9z &= 41 \end{aligned}$$

   Solution: $\begin{pmatrix} 5 & -4 & 8 & 83 \\ -2 & 0 & 5 & 53 \\ 4 & -3 & -9 & 41 \end{pmatrix}$

6. Pivot about the entry in the first row, third column of the matrix

   $\begin{pmatrix} 2 & 4 & 2 & 8 \\ 5 & 3 & 2 & 4 \\ 2 & -2 & 5 & 7 \end{pmatrix}$

   Solution: We get a 1 in the pivot entry by dividing the first row by 2.

   $R_1 \leftarrow \dfrac{R_1}{2} : \begin{pmatrix} 1 & 2 & 1 & 4 \\ 5 & 3 & 2 & 4 \\ 2 & -2 & 5 & 7 \end{pmatrix}$.

   We next get 0's elsewhere in the pivot column:

   $R_2 \leftarrow R_2 - 2R_1 : \begin{pmatrix} 1 & 2 & 1 & 4 \\ 3 & -1 & 0 & -4 \\ 2 & -2 & 5 & 7 \end{pmatrix}$, $R_3 \leftarrow R_3 - 5R_1 : \begin{pmatrix} 1 & 2 & 1 & 4 \\ 3 & -1 & 0 & -4 \\ -3 & -12 & 0 & -13 \end{pmatrix}$.

7. Use Gaussian Elimination on the following matrix.

$$\begin{pmatrix} 1 & 3 & 5 & 2 \\ 2 & 3 & 4 & 4 \\ 4 & 5 & 2 & 1 \end{pmatrix}$$

Solution: We start by pivoting about the first row, first column. Since there's already a 1 in the pivot entry, we get 0's elsewhere in the first column.

$$R_2 \leftarrow R_2 - 2R_1 : \begin{pmatrix} 1 & 3 & 5 & 2 \\ 0 & -3 & -6 & 0 \\ 4 & 5 & 2 & 1 \end{pmatrix}, \; R_3 \leftarrow R_3 - 4R_1 : \begin{pmatrix} 1 & 3 & 5 & 2 \\ 0 & -3 & -6 & 0 \\ 0 & -7 & -18 & -7 \end{pmatrix}.$$

We now pivot on the second row, second column. We start by getting a 1 in the pivot entry.

$$R_2 \leftarrow \frac{R_2}{-3} : \begin{pmatrix} 1 & 3 & 5 & 2 \\ 0 & 1 & 2 & 0 \\ 0 & -7 & -18 & -7 \end{pmatrix}.$$

We now get 0's elsewhere in the pivot column: $R_1 \leftarrow R_1 - 3R_2 : \begin{pmatrix} 1 & 0 & -1 & 2 \\ 0 & 1 & 2 & 0 \\ 0 & -7 & -18 & -7 \end{pmatrix}$,

$$R_3 \leftarrow R_3 + 7R_2 : \begin{pmatrix} 1 & 0 & -1 & 2 \\ 0 & 1 & 2 & 0 \\ 0 & 0 & -4 & -7 \end{pmatrix}.$$

We now pivot about the third row, third column. We start by getting a 1 in the pivot spot.

$$R_3 \leftarrow \frac{R_3}{-4} : \begin{pmatrix} 1 & 0 & -1 & 2 \\ 0 & 1 & 2 & 0 \\ 0 & 0 & 1 & \frac{7}{4} \end{pmatrix}.$$

We now get 0's elsewhere in the pivot column.

$$R_1 \leftarrow R_1 + R_3 : \begin{pmatrix} 1 & 0 & 0 & \frac{15}{4} \\ 0 & 1 & 2 & 0 \\ 0 & 0 & 1 & \frac{7}{4} \end{pmatrix}, \; R_2 \leftarrow R_2 - 2R_3 : \begin{pmatrix} 1 & 0 & 0 & \frac{15}{4} \\ 0 & 1 & 0 & -\frac{7}{2} \\ 0 & 0 & 1 & \frac{7}{4} \end{pmatrix}.$$

8. After using Gaussian Elimination to solve a system of equations, you obtain the following matrix. Interpret the solution set.

$$\begin{pmatrix} 1 & 4 & 0 & 3 \\ 0 & 0 & 1 & 2 \\ 0 & 0 & 0 & 0 \end{pmatrix}$$

Solution: If we let the variables be x, y, z, the rows correspond to the equations $x + 4y = 3$, $z = 2$, $0 = 0$. We can pick any value we want for the "free" variable y, let $x = 3 - 4y$ and $z = 2$.

We may describe the solution set as the set of values for x, y, and z for which $x = 3 - 4y$ and $z = 2$.

9. After using Gaussian Elimination to solve a system of equations, you obtain the following matrix. Interpret the solution set.

$$\begin{pmatrix} 1 & 5 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

Solution: If the variables are x, y, z, the rows correspond to the equations $x + 5y = 0$, $z = 0$ and $0 = 1$. Since the last clearly has no solution, neither does the system and the solution set is empty.
